

Arxiv Research Project Documentation

1. Project Overview

The Arxiv Research Project is a comprehensive research assistant system designed to streamline the process of searching, analyzing, and interacting with arXiv research papers. It leverages AI-powered analysis, conversational interfaces, and the Model Context Protocol (MCP) for seamless integration with development environments.

Key Features:

- **Intelligent Paper Search:** Efficiently find relevant research papers on arXiv using keywords, authors, or topics.
- **AI-Powered Analysis:** Obtain detailed paper analysis and insights using Mistral AI.
- **Interactive Chat Interface:** Engage in natural language conversations about research papers.
- **Multi-Paper Comparison:** Compare and analyze multiple papers simultaneously to identify commonalities and differences.
- **MCP Integration:** Provides seamless integration with Kiro IDE and other compatible development environments through the Model Context Protocol.
- **Web UI:** A user-friendly web interface built with Chainlit for easy interaction.

2. Architecture

The project is structured into several key components, each serving a specific purpose:

Plain Text

```
arxiv-research-project/  
├── arxiv-mcp-server-clean/      # MCP Server for arXiv + Mistral integration  
│   ├── arxiv_mcp_clean.py      # Main MCP server implementation  
│   ├── requirements.txt        # Python dependencies for the server  
│   └── .env.example            # Environment variables template for the  
server
```

```

├── README.md                # Server-specific documentation

│       └── mcp.json         # MCP server configuration for Kiro IDE
├── .gitignore              # Git ignore rules
└── README.md               # Main project README

```

Component Breakdown:

- **arxiv-mcp-server-clean/** : This directory contains the core logic for interacting with arXiv and Mistral AI. It acts as an MCP server, exposing functionalities like paper search, detail retrieval, AI analysis, and paper comparison as tools that can be consumed by compatible clients (e.g., Kiro IDE).
- **arxiv_mcp_clean.py** : Implements the MCP protocol and integrates with the **arxiv** and **mistralai** Python libraries to provide the core functionalities.
- **arxiv-chainlit-app/** : This is the web-based user interface for the project, built using the Chainlit framework. It provides a conversational interface for users to interact with the arXiv research assistant.
- **app.py** : Contains the Chainlit application logic, handling user commands, integrating with the arXiv API (and potentially the MCP server for AI functionalities), and displaying results.
- **arxiv-chat-ui/** : This directory contains a basic HTML and JavaScript-based chat interface. While present, the **arxiv-chainlit-app** provides a more feature-rich conversational experience.
- **.kiro/** : This directory holds configuration files specifically for the Kiro IDE, enabling it to connect and utilize the **arxiv-mcp-server-clean**.

3. Setup and Installation

To set up and run the Arxiv Research Project, follow these steps:

1. Clone the Repository

First, clone the project repository to your local machine:

Bash

```
git clone https://github.com/harishmogili21/Arxiv-Research-Project.git
cd Arxiv-Research-Project
```

2. Set Up Environment Variables

This project requires a Mistral AI API key for AI-powered analysis and chat functionalities. Copy the provided example environment files and then edit them with your actual API key.

Bash

```
cp arxiv-mcp-server-clean/.env.example arxiv-mcp-server-clean/.env
cp arxiv-chainlit-app/.env.example arxiv-chainlit-app/.env
```

Open the newly created `.env` files (e.g., `arxiv-mcp-server-clean/.env` and `arxiv-chainlit-app/.env`) and replace `your_mistral_api_key_here` with your actual Mistral AI API key. You can obtain an API key from <https://console.mistral.ai/>.

Example `.env` content:

Plain Text

```
MISTRAL_API_KEY=your_mistral_api_key_here
LOG_LEVEL=INFO # Optional: Logging level
```

3. Install Dependencies

Install the required Python dependencies for both the MCP server and the Web UI:

For the MCP Server:

Bash

```
cd arxiv-mcp-server-clean  
pip install -r requirements.txt
```

For the Web UI:

Bash

```
cd ../arxiv-chainlit-app  
pip install -r requirements.txt
```

Required Python Packages:

- **arxiv-mcp-server-clean/requirements.txt** :
 - fastmcp>=0.2.0
 - arxiv>=2.1.0
 - mistralai>=1.0.0
 - pydantic>=2.0.0
 - httpx>=0.25.0
 - python-dotenv>=1.0.0
 - PyPDF2>=3.0.0
 - tiktoken>=0.5.0
- **arxiv-chainlit-app/requirements.txt** :
 - chainlit (and its dependencies)
 - requests
 - python-dotenv
 - mistralai

4. Usage

There are two primary ways to use the Arxiv Research Project:

Option A: Run the MCP Server (for Kiro IDE integration)

If you intend to integrate with Kiro IDE or another MCP-compatible client, run the MCP server:

Bash

```
cd arxiv-mcp-server-clean  
python arxiv_mcp_clean.py
```

This will start the MCP server, making its functionalities available to connected clients.

MCP Server Functions (accessible via MCP client calls):

- ``search_arxiv_papers(query: str, max_results: int = 10, sort_by: str = "relevance")`` : Search arXiv for research papers by keywords, authors, or topics.
- `get_paper_details(arxiv_id: str)` : Get detailed information about a specific arXiv paper.
- `analyze_paper_with_mistral(arxiv_id: str, question: str = "Provide a comprehensive analysis of this paper")` : Analyze a research paper using Mistral AI.
- `chat_about_papers(message: str, paper_ids: List[str] = None)` : Have a conversation about research papers with AI assistance.
- `compare_papers(paper_ids: List[str])` : Compare multiple research papers.

Option B: Run the Web UI (for browser-based interface)

For a user-friendly, browser-based conversational interface, run the Chainlit application:

Bash

```
cd arxiv-chainlit-app  
chainlit run app.py -w
```

This command will start the Chainlit web server, and you can access the UI in your web browser (usually at `http://localhost:8000`). The `-w` flag enables auto-reloading on code changes.

Web UI Commands:

The Chainlit UI supports the following commands:

Command	Description	Example
<code>/search</code> <code><query></code>	Search for papers on arXiv.	<code>/search neural machine translation</code>
<code>/select</code> <code><number></code>	Select a paper from the search results to add to your chat context.	<code>/select 1</code>
<code>/papers</code>	Display the list of currently selected papers in your chat context.	<code>/papers</code>
<code>/analyze</code> <code><arxiv_id></code>	Analyze a specific paper using AI.	<code>/analyze 2203.14263v1</code>
(Just chat)	Engage in a natural conversation about the selected papers.	What are the key findings of these papers?

5. Development

Adding New Features

- **MCP Server:** To extend the functionalities of the MCP server, add new functions to `arxiv-mcp-server-clean/arxiv_mcp_clean.py` . These functions should encapsulate specific tasks (e.g., fetching data from a new source, performing a different type of analysis).
- **Web UI:** To add new commands or enhance the conversational flow in the web interface, modify `arxiv-chainlit-app/app.py` . This involves defining new `cl.on_message` handlers or extending existing ones.
- **Integration:** If new tools are added to the MCP server, ensure that the MCP configuration (e.g., `.kiro/settings/mcp.json` for Kiro IDE) is updated to include these new

tools and their input schemas.

Testing

To ensure the stability and correctness of the project, you can perform the following tests:

- **Test MCP Server Functions:** You can test individual MCP server functions directly from the Python interpreter or a script:
- **Test Web UI:** Run the Chainlit application and interact with it through your browser to test its functionalities:

6. Requirements

To run this project, you will need:

- **Python 3.8+:** The project is developed using Python and requires version 3.8 or newer.
- **Mistral AI API Key:** Essential for utilizing the AI-powered analysis and chat features. Obtainable from <https://console.mistral.ai/>.
- **Internet Connection:** Required for accessing the arXiv API and the Mistral AI API.
- **Kiro IDE (Optional):** For seamless integration with the MCP server. Alternatively, a web browser is sufficient for using the Chainlit UI.

7. Security Considerations

- **API Key Management:** All sensitive API keys (specifically the Mistral AI API key) are stored in `.env` files. These files are explicitly excluded from version control (`.gitignore`) to prevent accidental exposure.
- **Sensitive Data Handling:** The project is designed to mask sensitive data in configuration files and uses environment variables for all secrets, enhancing security.

8. Contributing

Contributions to the Arxiv Research Project are welcome! Please follow these steps to contribute:

1. **Fork the repository** on GitHub.
2. **Create a new feature branch** for your changes (e.g., `git checkout -b feature/my-new-feature`).
3. **Make your changes** and ensure they adhere to the project's coding standards.
4. **Add tests** for your new features or bug fixes, if applicable.
5. **Submit a pull request** to the `main` branch of the original repository, providing a clear description of your changes.

9. License

This project is open source. Feel free to modify and distribute it under the terms of its license (not explicitly stated in the README, but generally implies a permissive license like MIT or Apache 2.0 for open-source projects).

10. Acknowledgments

This project acknowledges and is grateful for the contributions of the following:

- **arXiv**: For providing open access to scholarly articles in physics, mathematics, computer science, quantitative biology, quantitative finance, statistics, electrical engineering and systems science, and economics.
- **Mistral AI**: For their powerful language models that enable the AI-powered analysis and conversational capabilities.
- **Chainlit**: For providing the framework used to build the interactive conversational UI.
- **MCP (Model Context Protocol)**: For the integration protocol that allows seamless interaction with development environments like Kiro IDE.

Built with ❤️ for researchers and AI enthusiasts
